FIRMette Tutorial

A FIRMette is a full-scale section of a FEMA Flood Insurance Rate Map (FIRM) that you create yourself online by selecting the desired area from an image of a Flood Insurance Rate Map. The FIRMette also includes the map title block, north arrow, and scale bar. There is no charge for making a FIRMette. And because a FIRMette is a full-scale section of an official FEMA Flood Insurance Rate Map, it can be used in all aspects of the NFIP, including floodplain management, flood insurance, and enforcement of mandatory flood insurance purchase requirements.

Instructions for making a FIRMette:

- **Step 1:** [Find your flood map](#)
- **Step 2:** [Make the FIRMette](#)

GIS Q3

MassGIS Data - FEMA Q3 Flood Zones from Paper FIRMs

July 1997

[Download this layer](#)  (66 MB)
(Shapefiles with ArcGIS 10.0 layer files and FEMA-produced metadata)

IMPORTANT NOTE: IT IS NOT APPROPRIATE TO USE THIS DATALAYER FOR LARGE-SCALE (DETAILED, E.G. PARCEL LEVEL) MAPPING AND ANALYSIS. PLEASE READ ALL DOCUMENTATION PROVIDED BY FEMA TO ENSURE YOU UNDERSTAND THE PROPER USE OF THESE DATA.

Many parts of the state are now updated using DFIRM data. See the [FEMA National Flood Hazard Layer](#) page for details.

Overview

These data represent a subset of the data available on the paper [Flood Insurance Rate Maps](#) (FIRM) as provided by the [Federal Emergency Management Agency](#) (FEMA). The Q3 flood data were developed to support floodplain management and planning activities but do not replace the official paper FIRMs. These data are not suitable for engineering applications or site work nor can the data be used to determine absolute delineation of flood boundaries. Instead the data should be used to portray zones of uncertainty and possible risks associated with flooding. **All counties except Franklin are available for Massachusetts.**

In ArcSDE the layer is named **Q3FLOOD_POLY**.

A subset of this layer, created by MassGIS in October 2013 and named **Q3FLOOD_POLY_NO_NFHL**, includes data only for areas for which the [FEMA National Flood Hazard Layer](#) is not available. This allows users to

THE OLD MAPS AND GIS Q3

- The old maps were very good for when they were created. They are poor compared to today's standards.
- The GIS Q3 layer was digitized from the maps. The digitization does not always match the paper maps and the paper maps do not always match the ground conditions.
- In many locations, the ground has changed since the old maps were created.

Subsidence – Uplift – Erosion – Accretion – Avulsion

 EFFECTIVE DATE
 JULY 16, 2014

Federal Emergency Management Agency

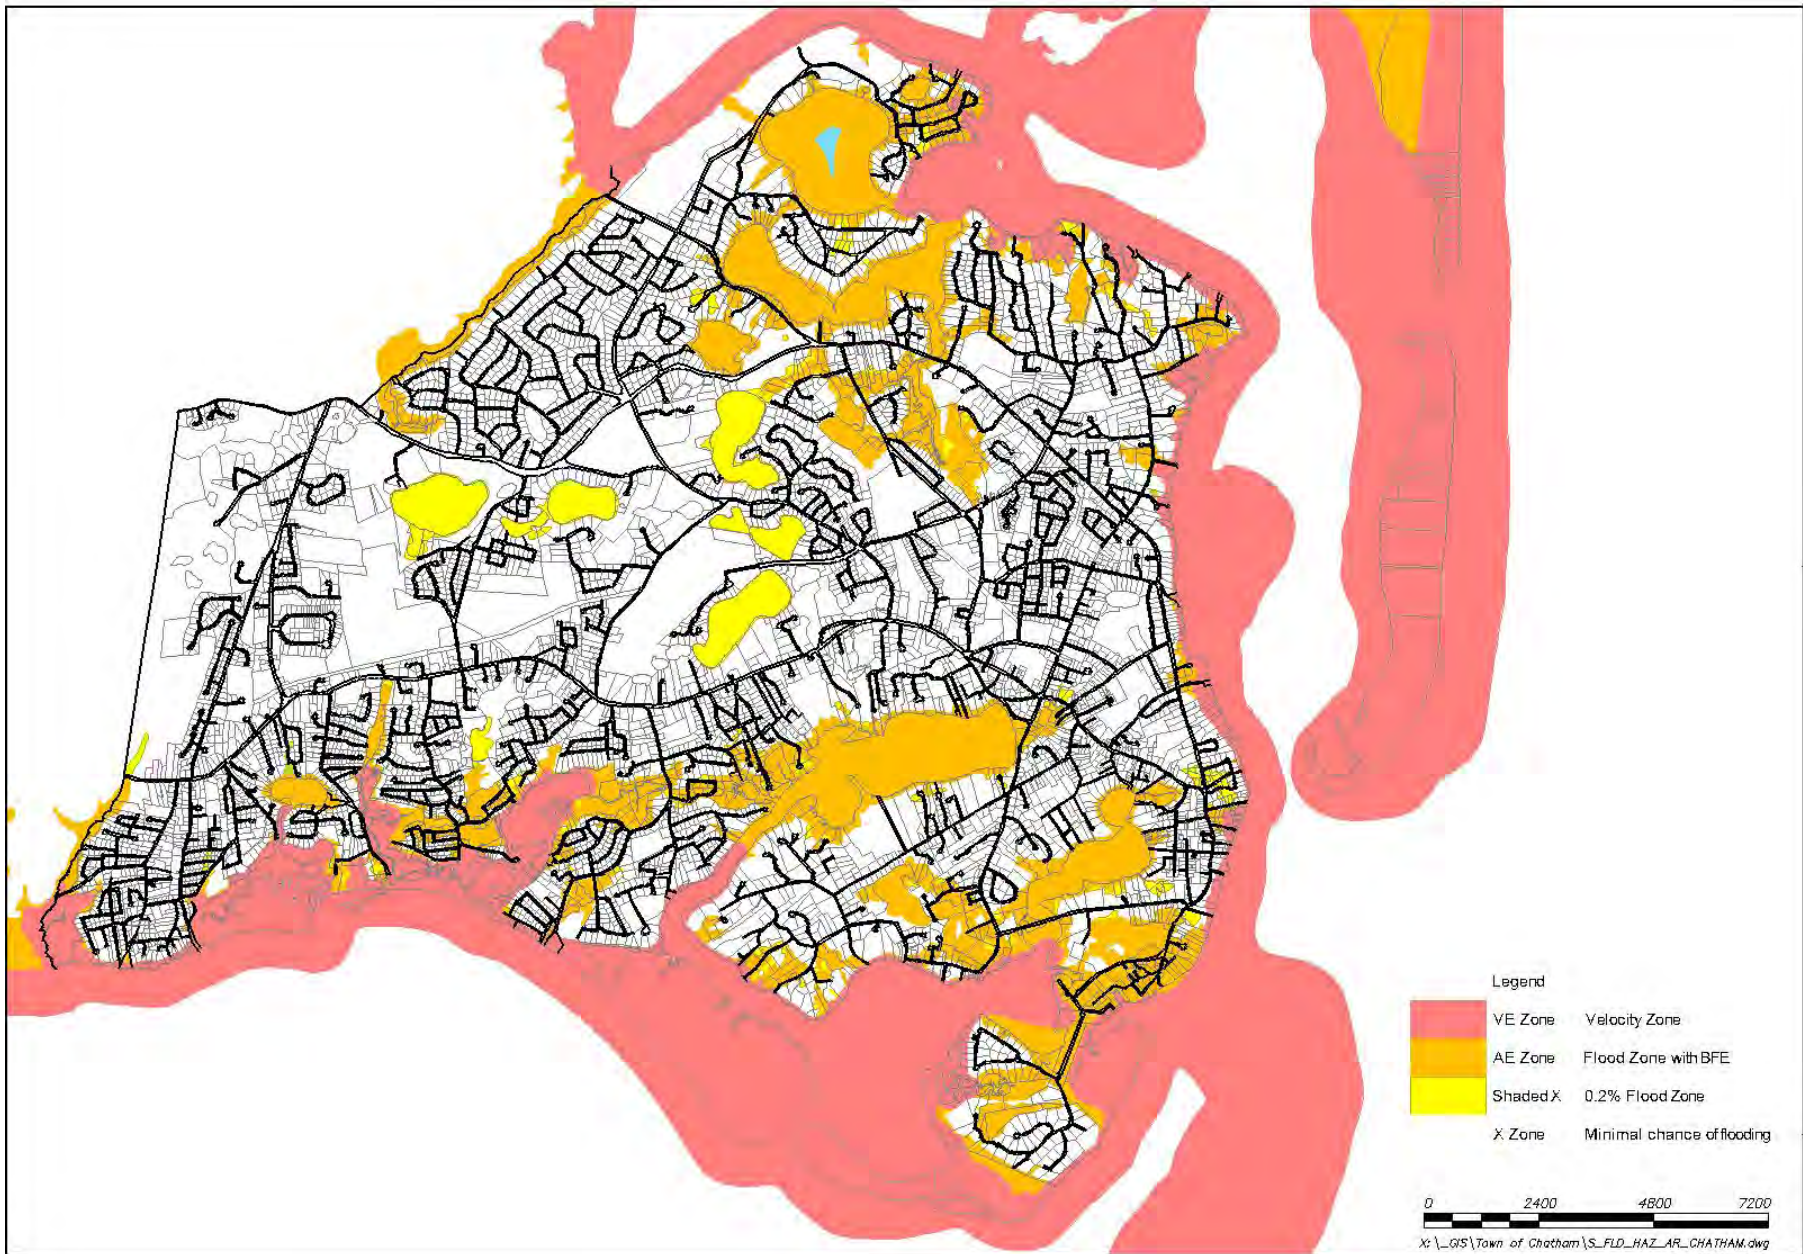

This is an official copy of a portion of the above referenced flood map. It was extracted using FIRMette - Desktop version 3.0. This map does not reflect changes or amendments which may have been made subsequent to the date on the title block. Further information about National Flood Insurance Program flood hazard maps is available at <http://www.msc.fema.gov/>.

GIS 2014

THE NEW MAPS

- The new maps are much better than the old maps.
- The new datalayer matches the new maps. These maps do not always match the ground conditions.
- The ground has not had a real chance to change except for fluctuant locations.
- The data is much better for parcel level evaluation.

Dissecting the new maps.

- The vertical data comes from aerial lidar information. (“Lasers”)
- The lidar data was then gridded into GeoTiffs.
- The grid cell size is a meter or greater.
- The vertical accuracy varies (0.2’ – 0.5’ – N/A).
- The underlying aerial orthophotographs are from the MassGIS archives. (In Massachusetts)

The Lidar
geotiffs
are
available
from
MassGIS.

2011 Nashua River	May 6-7, 2011	4	0.92 m	FVA = 0.172 m	1 m	Ground-classified LAS 1.2	NA	All returns in LAS file	UTM Zone 19N NAD83/NAVD88 Meters
2011 LiDAR for the Northeast	Winter-Spring 2011 *C	4	< 1 m	FVA = 0.30 m *D	1 m	Ground-classified LAS 1.2	NA	All returns in LAS file	UTM Zone 19N NAD83/NAVD88 Meters

Notes:

*A Scan lines show paired points approximately 0.6 m apart, and 2.3 m along scan, and 2.65 m between lines, 3.25 m between centers of paired lines.

*B The bare-earth points have a Fundamental Vertical Accuracy of 1.2 ft. (36.3 cm) or better at the 95% confidence level in open terrain

*C LiDAR data acquired along the Massachusetts coast was flown at Daily Predicted Low Tide plus or minus 90 minutes.

*D Barnstable County was flown and processed to meet a bare earth Fundamental Vertical Accuracy (FVA) of 18.13 cm at a 95% confidence level, derived according to NSSDA, i.e., based on vRMSE of 9.25 cm in the "open terrain" land cover category.

LiDAR Index

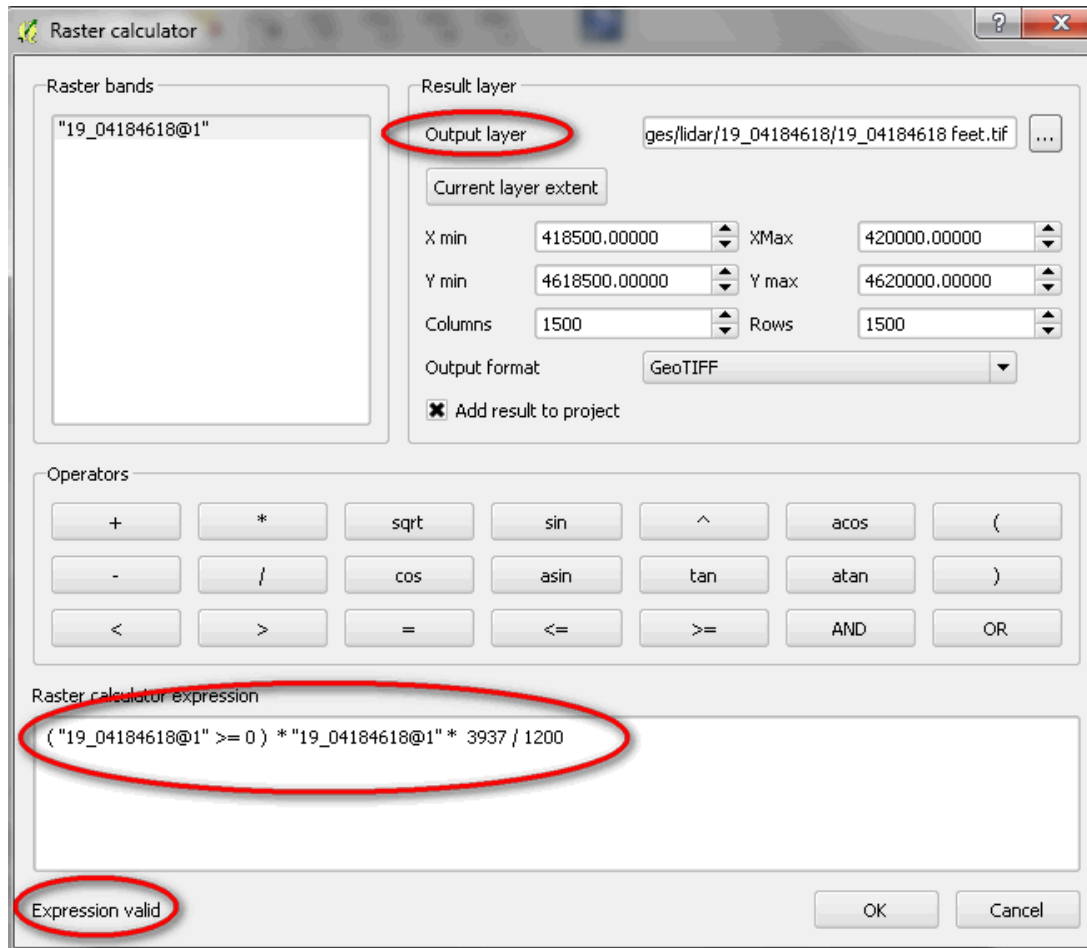

Converting lidar geotiffs to Contours

- GeoTiffs are not typically used with engineering plans.
- Some CAD products work well with GeoTiffs.
- Some ARC products will export some contours.
- QGIS (Quantum GIS) is a free means to convert GeoTiffs to contour shape files.

Import a geotiff into QGIS

Raster Calculator will create a new geotiff with the vertical unit in feet.

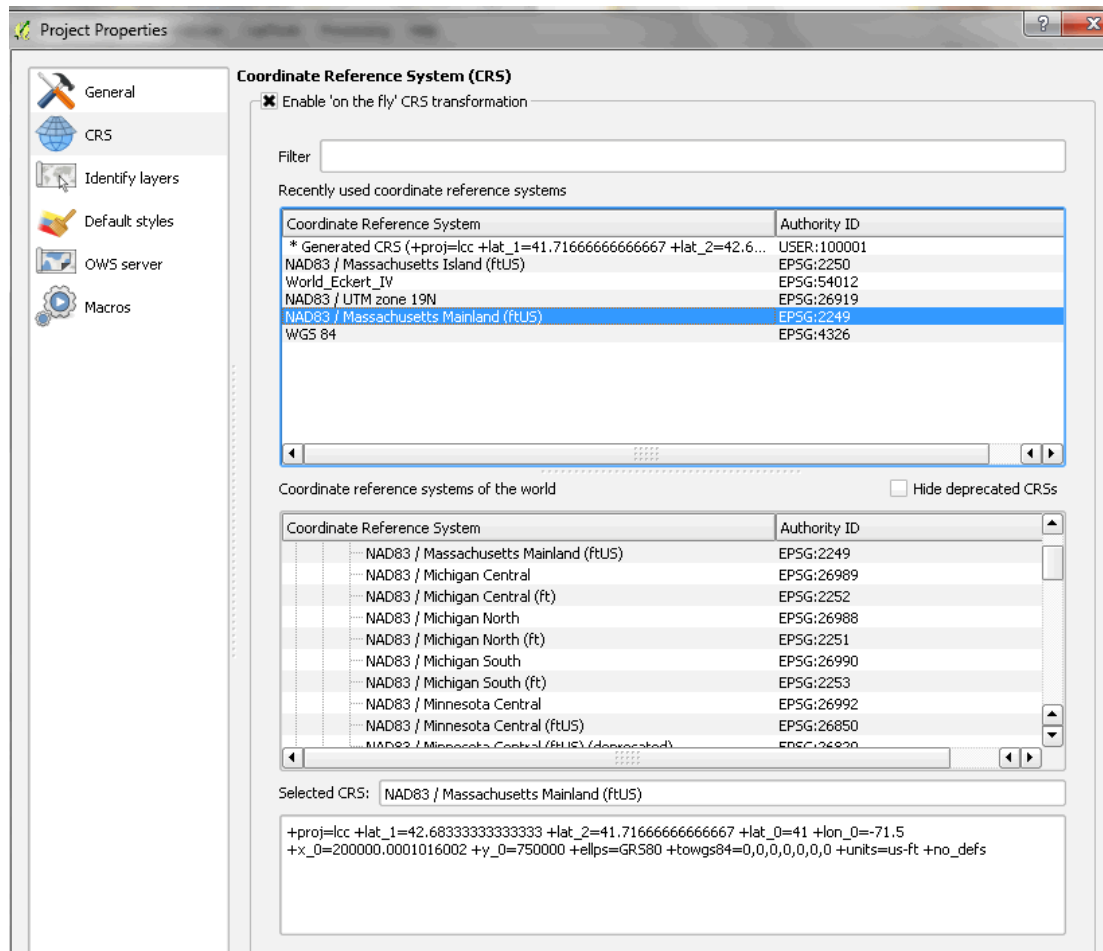

Output to a new GeoTiff, the simplest means is to add the suffix 'feet' to the same filename.

The logical statement translates to:

If the cell value is greater than or equal to zero, then return that cell converted to feet.

Use project properties under the project menu to convert the horizontal datum.

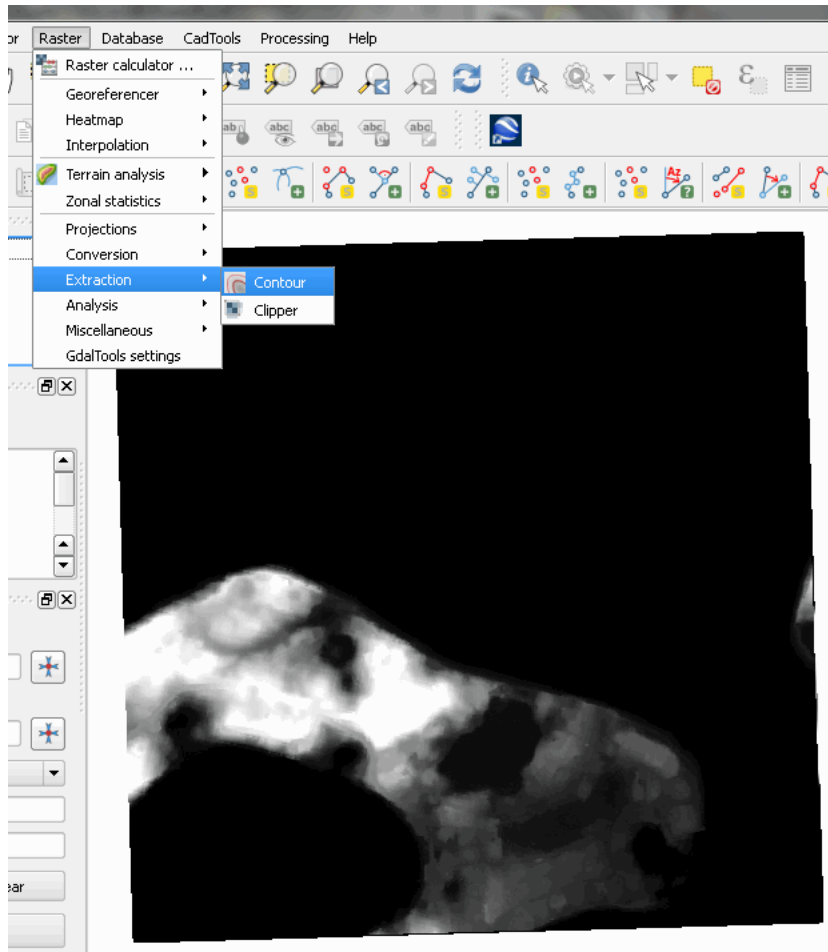

You must enable 'On the Fly Conversion'

The list is long.

This is not necessary as other settings are needed to export a shape file in the coordinate system you want.

Now that everything is set in your desired coordinate system, you can extract some contours.

Select an output, a contour interval, an attribute and pull it into the current drawing.

Hit OK and...

Now you are left to bring the shape file
into CAD...

but why did we go through this
exercise?

(Spoiler alert)

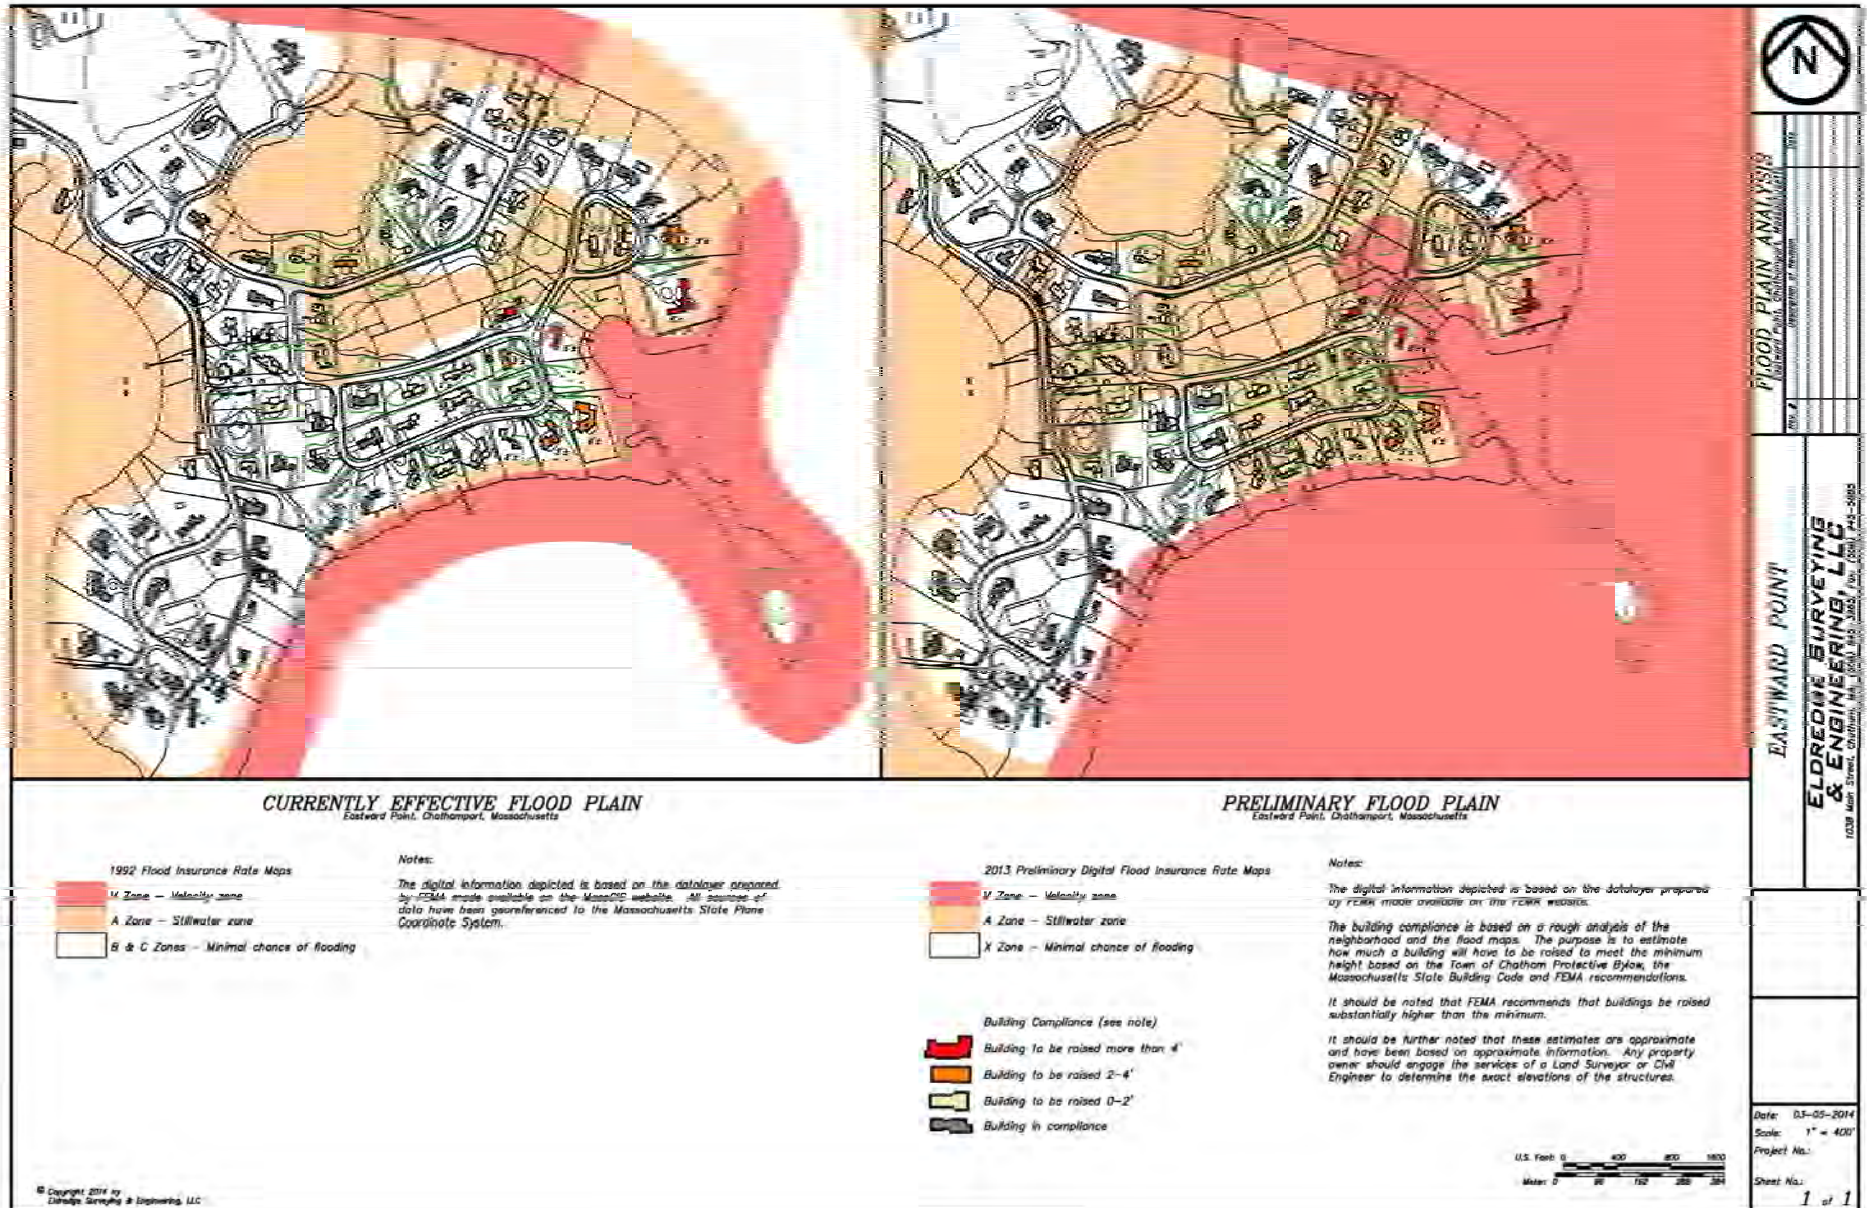

This happens to be in an area where
the new FIRMs do not match the
ground conditions.

The areas in Orange are mapped AE but based on the lidar have elevations that exceed the BFE. The areas in red have elevation below the BFE.

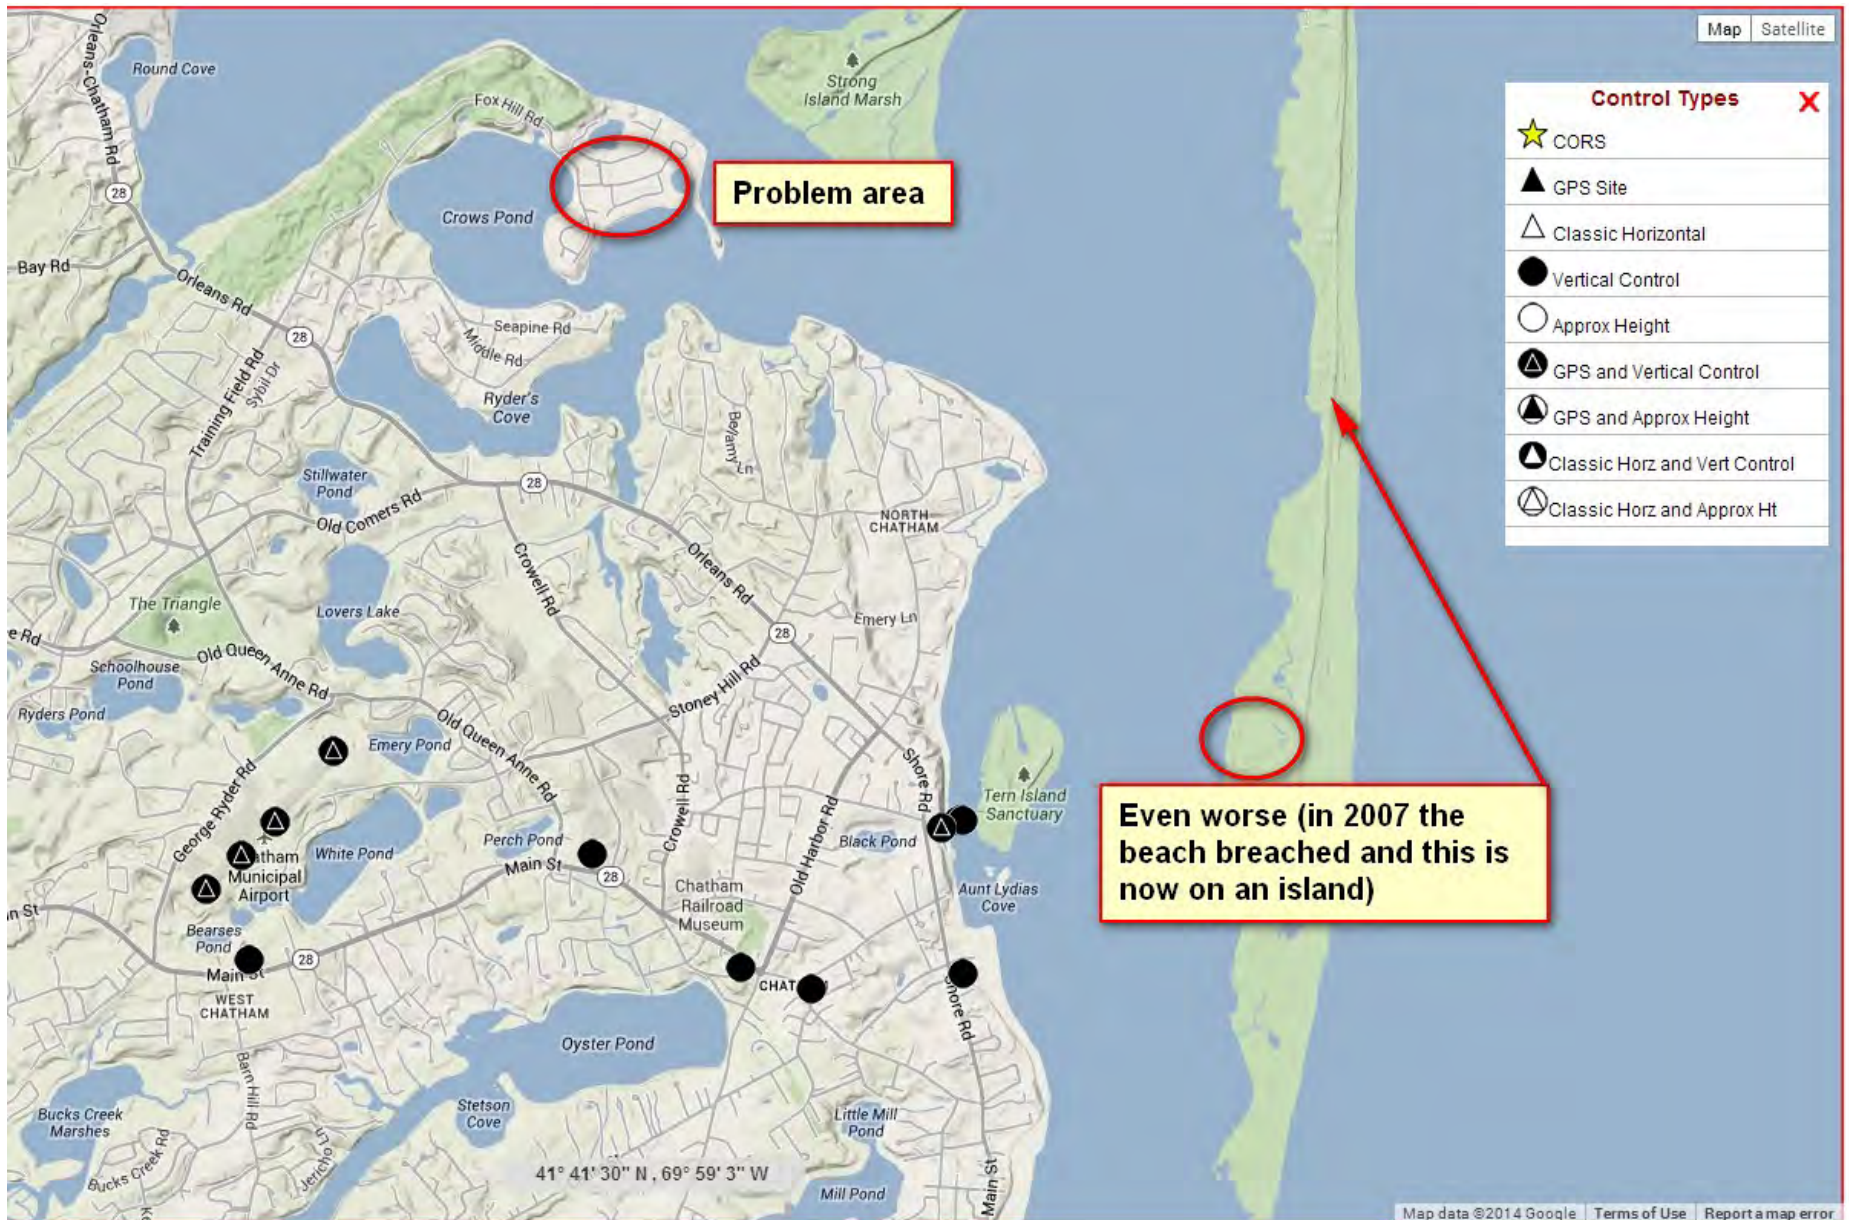

- Good news: LOMAs will still be necessary!
- Better news: It takes a minimal investment of time to identify properties and structures that will likely qualify for removal from the flood hazard zone.

This plan depicts the differences between the older flood maps and the new flood maps.

Benchmarks...

- The FIRMs have a limited number of benchmarks.
- The benchmarks come directly from the NGS database.
- The NGS may not have run levels or established benchmarks near a project. (The outer Cape, Orleans to Provincetown)

This has worked better on IE (Internet Explorer) than in Chrome.

- Benchmarks are not convenient.
- Level runs for the miles and miles will ruin a project budget.
- Can we use GPS?

GPS was used to establish an elevation at the site on the Island.

Vertical Results with GPS

NGS Procedures

NGS-58

- Dual frequency GPS receivers.
- Reference to at least 3 existing A- or B- order 3-d control stations.
- For control and primary base stations, collect 5 hour simultaneous sessions on three different days in the project.
- For other stations, each baseline (adjacent station pair) must be occupied for a minimum of a 30 minute simultaneous session.
- Spacing cannot exceed 10 km, average spacing less than 7 km.
- Primary base stations
- 15 hours minimum for your first benchmark...
30 minutes minimum for each mark thereafter.

NGS-59

- Follow NGS-58 specifications.
- Use the latest geoid model (12A).
- Use the most recent datum (NAVD 88).
- Occupy stations with valid NAVD 88 orthometric heights with an even distribution throughout the project.
- Keep distances between valid NAVD 88 benchmarks to less than 20 km.
- In mountainous areas, occupy additional benchmarks at varying elevations.
- Perform 3-d minimally constrained least squares adjustment (hold one Lat/Long and one Ortho Height).
- Find and remove the outliers, reprocess and find and remove all outliers.
- Compute between the differences between the results and published elevations.
- Determine which benchmark elevations are suitable to use.
- Constrain all valid observations and elevations and create the final solution.
- Check the results for obvious distortions.

Really?

That much work for a benchmark?

- Shorter baselines.
- Tie into level loops
- Add observations into network solutions over many days.
- OPUS Projects. (OPUS)
- Networks solutions. Free, subscription or other data added can only better a solution.

What could go wrong?

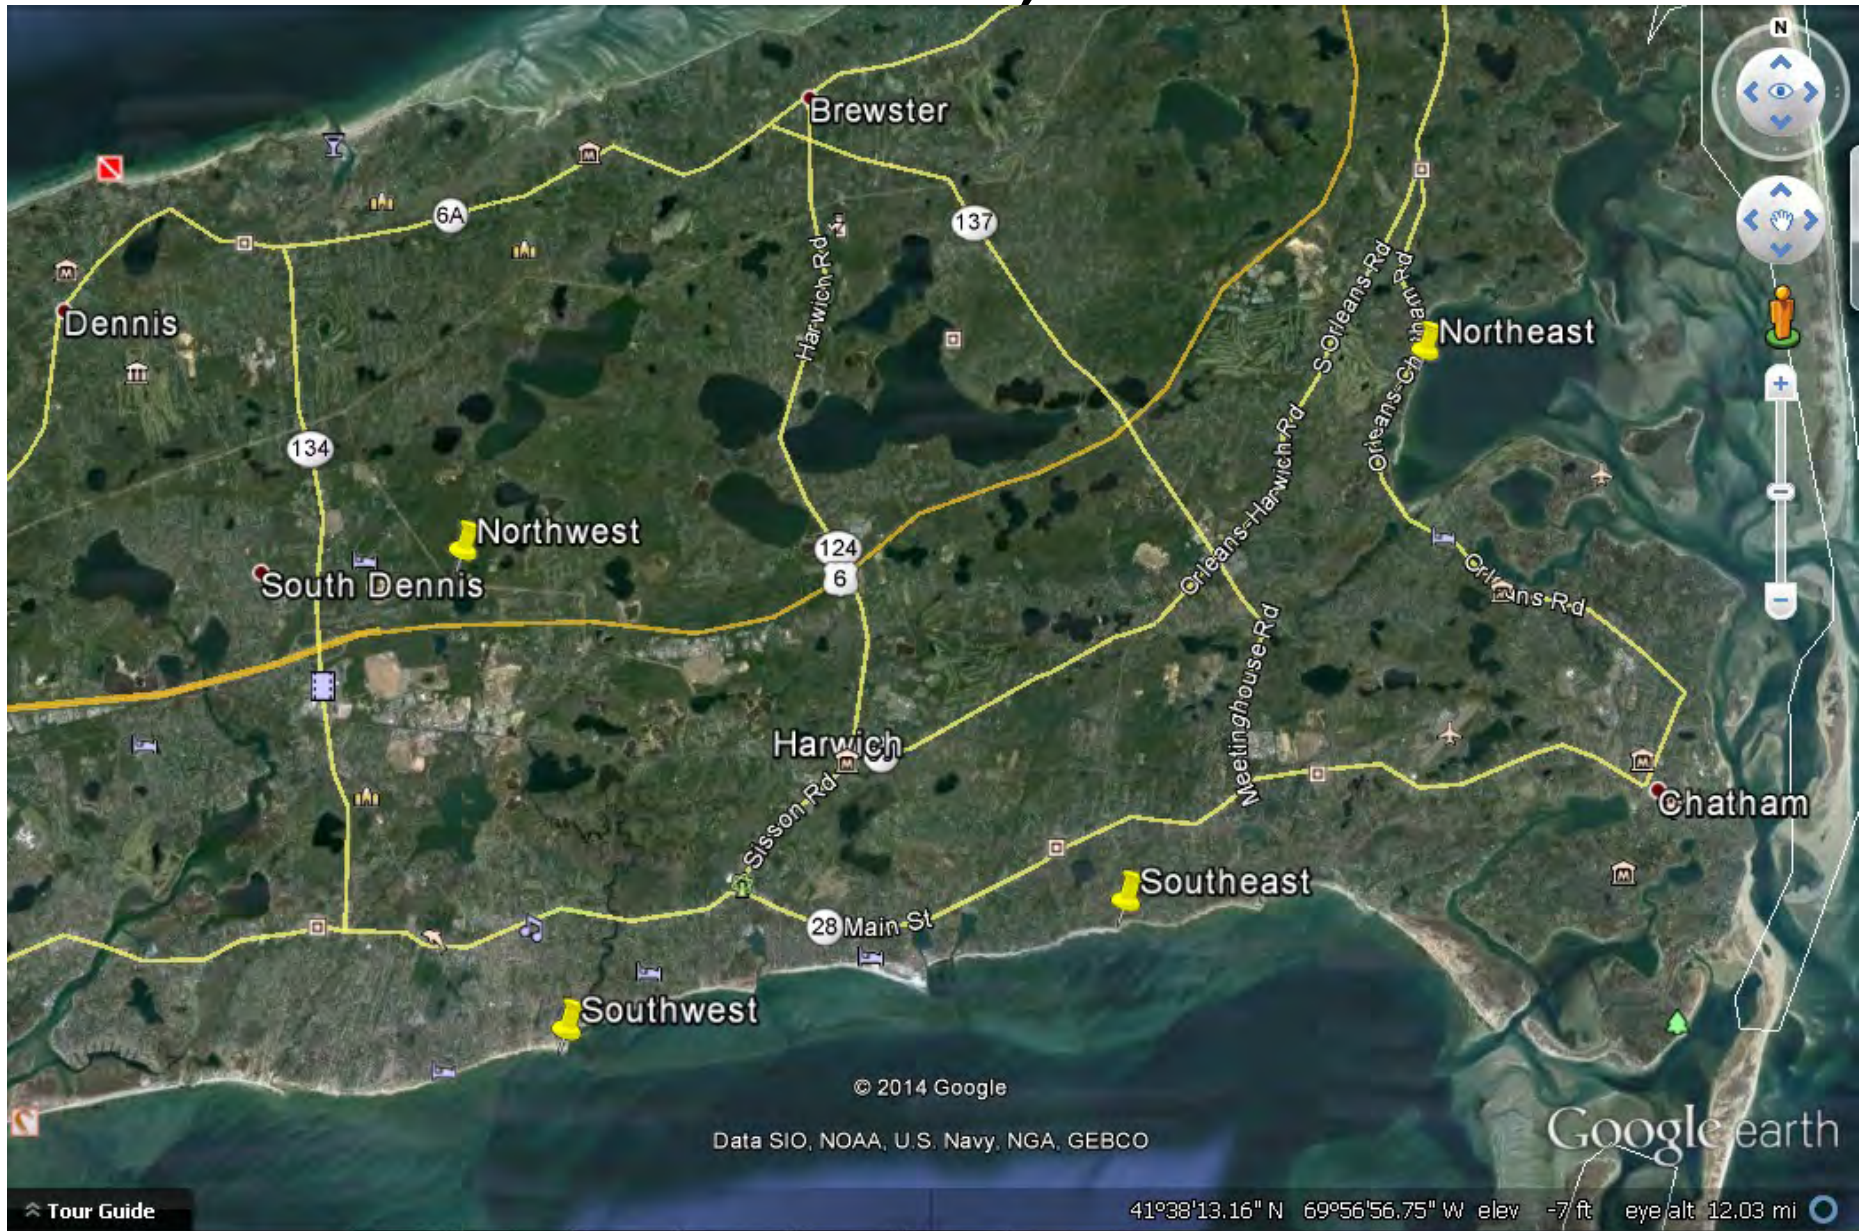

- Avoid RTK GPS unless you have other suitable measurements.
- Avoid Trigonometric Leveling unless you have other suitable measurements.
- RTK locations of adequate points in a traverse loop could provide suitable results.
- RTK can be helpful to verify level runs, trigonometric levels and traverses.

- Test your methods and determine your level of comfort.
- Test the information you rely upon. Question everything.

VertCon / CorpsCon

- CorpsCon uses the Vertcon Model for the conversion between NGVD 29 and NAVD 88.
- The VertCon documentation claims that it is not suitable for 1st, 2nd or 3rd Order Heights. (3rd Order = 0.05' per root mile (square root))
- Verification of the VertCon model can and should be completed before considering relying upon it.

Harwich, MA

Tour Guide

3.496	12.603	-1.133	
4.956	17.390	-1.130	
2.861	10.500	-1.114	
5.109	17.856	-1.094	
Average		-1.124	
Range/2		0.022	
			Vertcon
Northeast			-0.883
Southeast			-0.886
Southwest			-0.883
Northwest			-0.876
Average		-0.882	
Difference between the two solutions			0.242

The NAVD benchmarks (in meters) and the NGVD benchmarks (in feet) are compared in feet.

The three records in red have been disregarded. The others match within reason.

The VertCon results have been averaged, the range is minimal.

There is a 0.24' difference between the two conversions.

Which would you hold?

This represents the same benchmark in Harwich at different times.

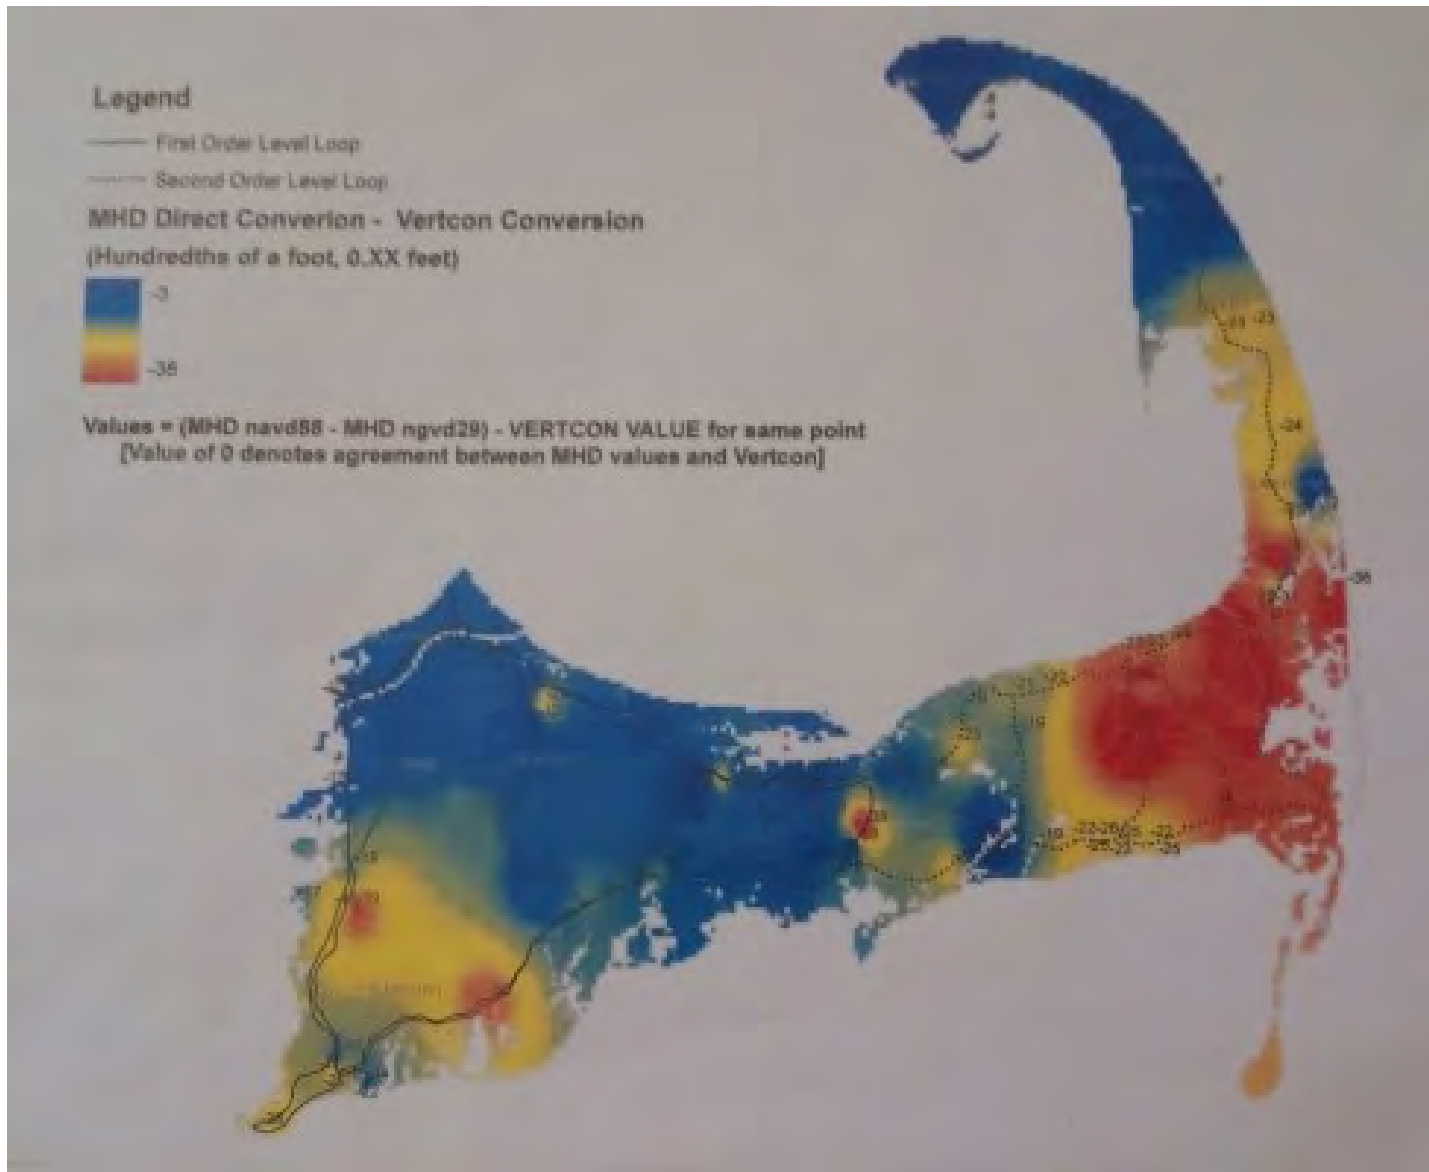

The first benchmark was established at **5.00' NGVD**.

The second benchmark is the elevation of the first with the VertCon conversion applied to result in **4.12' NAVD**.

The third benchmark is the actual location of the monument factoring in subsidence, **3.88' NAVD**.

The relation between NGVD and NAVD is the same, the subsidence caused change to the elevation of the monument.

MassDOT Survey has worked on the conversion from NGVD and NAVD.

The most likely cause for the difference or error in the VertCon model is subsidence.

The following shows the variation between the conversion and the comparison ranging from 0.03' to 0.38'.

MHD used their level loops to calculate the error when using VertCon.

Local Subsidence

- The NGVD benchmarks were set in the 40's and 50's.
- The NAVD benchmarks were sets in the 90's and 00's.
- There was about 50 years of subsidence between the two sets.
- $0.03' \Rightarrow \mathbf{0.06'}$ of subsidence in a century.
- $0.38' \Rightarrow \mathbf{0.76'}$ of subsidence in a century.

There was a CORS in Chatham until 2002.

The velocity was computed in 2011.

There are some young CORS stations that have computed velocity data.

The information can be found under the Coordinates Section of the CORS Station Page.

IGS 08
CHATHAM 1 (CHT1), MASSACHUSETTS

Created on 31Aug2011 at 09:27:49.

Antenna Reference Point (ARP): CHATHAM 1 CORS ARP

PID = AF9494

IGS08 POSITION (EPOCH 2005.0)

Computed in Aug 2011 using data through gpswk 1631.

X = 1635805.998 m latitude = 41 40 16.33113 N
Y = -4482177.301 m longitude = 069 57 00.16796 W
Z = 4218387.531 m ellipsoid height = -10.618 m

IGS08 VELOCITY

Computed in Aug 2011 using data through gpswk 1631.

VX = -0.0154 m/yr northward = 0.0051 m/yr
VY = -0.0011 m/yr eastward = -0.0148 m/yr
VZ = 0.0031 m/yr upward = -0.0011 m/yr

NAD_83 (2011) POSITION (EPOCH 2010.0)

Transformed from IGS08 (epoch 2005.0) position in Aug 2011.

X = 1635806.696 m latitude = 41 40 16.29772 N
Y = -4482178.759 m longitude = 069 57 00.16120 W
Z = 4218387.583 m ellipsoid height = -9.382 m

NAD_83 (2011) VELOCITY

Transformed from IGS08 velocity in Aug 2011.

VX = 0.0018 m/yr northward = -0.0025 m/yr
VY = 0.0005 m/yr eastward = 0.0019 m/yr
VZ = -0.0032 m/yr upward = -0.0020 m/yr

L1 Phase Center of the current GPS antenna: CHATHAM 1 CORS L1 PC C

The Geodetic III "Whopper" Model 700829.3 (U antenna

(Antenna Code = ASH700829.3 SNOW) was installed on 26Jun1995.

The L2 phase center is 0.017 m below the L1 phase center.

PID = AJ7865

IGS08 POSITION (EPOCH 2005.0)

Computed in Aug 2011 using data through gpswk 1631.

X = 1635806.014 m latitude = 41 40 16.33111 N
Y = -4482177.351 m longitude = 069 57 00.16801 W
Z = 4218387.577 m ellipsoid height = -10.549 m

The IGS08 VELOCITY of the L1 PC is the same as that for the ARP.

Velocity

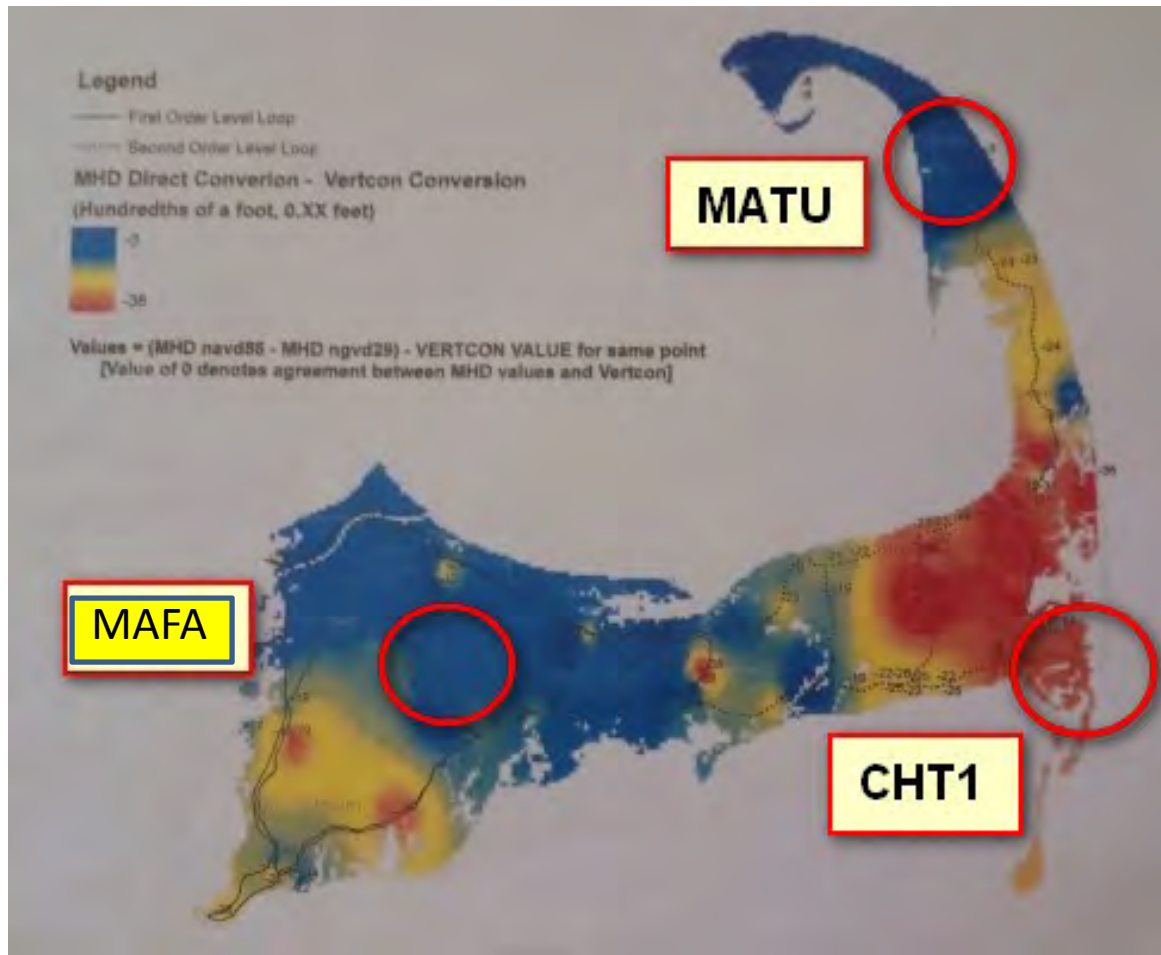

The MassDOT map shows a maximum observed subsidence of about -0.76 feet per century. This converts to **-0.0023 m/yr**.

The station data lists an upward velocity of **-0.0020 m/yr**. This converts to 0.66 feet per century.

Time becomes important. The MassDOT data ranged from the 40's to the 00's. The CORS Station went online in 1995 and was decommissioned in 2002.

The exact rate of subsidence or uplift at a given location cannot be accurately mapped by the CORS network; the guidelines space the stations too far apart.

3 CORS on Cape Cod

CHT1 was decommissioned in 2002. The velocity is historic.

MATU and MAFL were added to the CORS network in 2013.

The two MassDOT CORS stations are on relatively stable ground. The velocities computed for these will not adequately define the more rapid velocities.

The NGS has guidelines to space CORS stations... Cape Cod is now full.

Homemade CORS

This is an old 'Whopper III' geodetic antenna. Incidentally it is the same antenna that was used for CHT1.

Old GPS units are readily available or collecting dust in closets and storerooms.

Try to meet the CORS guidelines outlined on the NGS website.

Note: To become an official CORS, there must be a 70 km station separation to other CORS or be for the resolution of an issue in the area.

Guidelines for Establishing and Operating CORS

NOAA's National Geodetic Survey (NGS) invites organizations and individuals to share data from their permanent GPS base stations by including these stations in the National CORS network. Each CORS must meet the specifications described in the [CORS Guidelines \(pdf\) - Jan 2013](#)

Joining the Continuously Operating Reference Station (CORS) Network Key Requirements

- Receiver/Antenna is at least dual frequency (L1 and L2)
- Receiver tracks at least ten satellites above 0 degrees
- Receiver provides L1 C/A-code pseudorange or P-code pseudorange
- Receiver provides L1 and L2 full wavelength carrier phase
- Receiver and Antenna models must use international **codes**
- Antenna and monument must be coupled by an **orienting/leveling device**
- Antenna oriented to TRUE north (**Calculate Magnetic Declination**)
- Antenna has NGS phase center variability model available (<http://www.ngs.noaa.gov/ANTCAL>)
- Equipment metadata including photographs and station log must be provided
 - Photos (**Description**) (**Sample**)
 - Logs (**Blank Log**) (**Log Instructions**) (**Log Checker**)
- Data are freely available for distribution
- Data are recorded on a 30-second or shorter interval
- Provider has on-site Internet access
- Provider maintains all equipment
- Provider agrees to adopt positional coordinates sanctioned by NGS

Status of Future or Proposed CORS

Unofficial CORS...

This GPS antenna does not meet many of the specifications for a CORS. Perhaps one day the station will be updated to be more stable. UHF RTK or Cell Phone RTK can be added. This is a GPS receiver and an obvious upgrade would be to a GNSS receiver.

This allows for the recordation of long data sets. The sets can be uploaded to OPUS, OPUS Projects or used for in-house computations.

Meeting the guidelines specified in NGS-58 and NGS-59 became substantially easier with this station.

Processing GPS Data

- NGS
- OPUS, OPUS Projects
- Good results
- GPS only (Sorry GNSS)
- Long data sets
- E-mails...
- SELF
- Various software packages
 - TopCon Tools for raw GPS processing
 - Carlson SurvNet for least squares adjustment
 - You choose your own poison.
- Options for more data
 - Total station
 - Leveling
 - Other GPS
- Better output options

Private CORS stations (for fee and for free) can be found.

MTS charges fees for their RTK Network and provides their static data free of charge.

The additional CORS data can be helpful when geometry is a concern. At the moment, the MassDOT CORS Station on Nantucket is not in operation. The use of the two CORS on Cape Cod combined with the MTS CORS on Nantucket will provide a better geometry and therefore (hopefully / typically / usually / sometimes) a better solution.

ELEVATION CERTIFICATE

Important: Read the instructions on pages 1-9.

OMB No. 1660-0008
 Expiration Date: July 31, 2015

SECTION A – PROPERTY INFORMATION			FOR INSURANCE COMPANY USE
A1. Building Owner's Name			Policy Number:
A2. Building Street Address (including Apt., Unit, Suite, and/or Bldg. No.) or P.O. Route and Box No.			Company NAIC Number:
City	State	ZIP Code	
A3. Property Description (Lot and Block Numbers, Tax Parcel Number, Legal Description, etc.)			
A4. Building Use (e.g., Residential, Non-Residential, Addition, Accessory, etc.) _____			
A5. Latitude/Longitude: Lat. _____ Long. _____ Horizontal Datum: <input type="checkbox"/> NAD 1927 <input type="checkbox"/> NAD 1983			
A6. Attach at least 2 photographs of the building if the Certificate is being used to obtain flood insurance.			
A7. Building Diagram Number _____			
A8. For a building with a crawlspace or enclosure(s):		A9. For a building with an attached garage:	
a) Square footage of crawlspace or enclosure(s) _____ sq ft		a) Square footage of attached garage _____ sq ft	
b) Number of permanent flood openings in the crawlspace or enclosure(s) within 1.0 foot above adjacent grade _____		b) Number of permanent flood openings in the attached garage within 1.0 foot above adjacent grade _____	
c) Total net area of flood openings in A8.b _____ sq in		c) Total net area of flood openings in A9.b _____ sq in	
d) Engineered flood openings? <input type="checkbox"/> Yes <input type="checkbox"/> No		d) Engineered flood openings? <input type="checkbox"/> Yes <input type="checkbox"/> No	

SECTION B – FLOOD INSURANCE RATE MAP (FIRM) INFORMATION					
B1. NFIP Community Name & Community Number		B2. County Name		B3. State	
B4. Map/Panel Number	B5. Suffix	B6. FIRM Index Date	B7. FIRM Panel Effective/Revised Date	B8. Flood Zone(s)	B9. Base Flood Elevation(s) (Zone AO, use base flood depth)
B10. Indicate the source of the Base Flood Elevation (BFE) data or base flood depth entered in Item B9. <input type="checkbox"/> FIS Profile <input type="checkbox"/> FIRM <input type="checkbox"/> Community Determined <input type="checkbox"/> Other/Source: _____					
B11. Indicate elevation datum used for BFE in Item B9: <input type="checkbox"/> NGVD 1929 <input type="checkbox"/> NAVD 1988 <input type="checkbox"/> Other/Source: _____					
B12. Is the building located in a Coastal Barrier Resources System (CBRS) area or Otherwise Protected Area (OPA)? <input type="checkbox"/> Yes <input type="checkbox"/> No Designation Date: _____ <input type="checkbox"/> CBRS <input type="checkbox"/> OPA					

SECTION C – BUILDING ELEVATION INFORMATION (SURVEY REQUIRED)	
C1. Building elevations are based on: <input type="checkbox"/> Construction Drawings* <input type="checkbox"/> Building Under Construction* <input type="checkbox"/> Finished Construction *A new Elevation Certificate will be required when construction of the building is complete.	
C2. Elevations – Zones A1–A30, AE, AH, A (with BFE), VE, V1–V30, V (with BFE), AR, AR/A, AR/AE, AR/A1–A30, AR/AH, AR/AO. Complete Items C2.a–h below according to the building diagram specified in Item A7. In Puerto Rico only, enter meters. Benchmark Utilized: _____ Vertical Datum: _____ Indicate elevation datum used for the elevations in items a) through h) below. <input type="checkbox"/> NGVD 1929 <input type="checkbox"/> NAVD 1988 <input type="checkbox"/> Other/Source: _____ Datum used for building elevations must be the same as that used for the BFE.	
Check the measurement used.	
a) Top of bottom floor (including basement, crawlspace, or enclosure floor) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
b) Top of the next higher floor _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
c) Bottom of the lowest horizontal structural member (V Zones only) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
d) Attached garage (top of slab) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
e) Lowest elevation of machinery or equipment servicing the building (Describe type of equipment and location in Comments) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
f) Lowest adjacent (finished) grade next to building (LAG) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
g) Highest adjacent (finished) grade next to building (HAG) _____	<input type="checkbox"/> feet <input type="checkbox"/> meters
h) Lowest adjacent grade at lowest elevation of deck or stairs, including structural support _____	<input type="checkbox"/> feet <input type="checkbox"/> meters

SECTION D – SURVEYOR, ENGINEER, OR ARCHITECT CERTIFICATION			
This certification is to be signed and sealed by a land surveyor, engineer, or architect authorized by law to certify elevation information. I certify that the information on this Certificate represents my best efforts to interpret the data available. I understand that any false statement may be punishable by fine or imprisonment under 18 U.S. Code, Section 1001.			
<input type="checkbox"/> Check here if comments are provided on back of form.		Were latitude and longitude in Section A provided by a licensed land surveyor? <input type="checkbox"/> Yes <input type="checkbox"/> No	
<input type="checkbox"/> Check here if attachments.			
Certifier's Name	License Number		
Title	Company Name		
Address	City	State	ZIP Code
Signature	Date	Telephone	

PLACE SEAL HERE

Most of the form is relatively straight forward.

The building diagram often provides a reason to reconsider.

Even though the form provides one the ability to produce data on different datums, use **one**.

The elevations are fairly straight forward.

I have two questions: Window Wells (Lowest adjacent grade) and Electric Meters (attached and detached, lowest elevation of machinery or equipment servicing the building).

ELEVATION CERTIFICATE, page 2

IMPORTANT: In these spaces, copy the corresponding information from Section A.			FOR INSURANCE COMPANY USE	
Building Street Address (including Apt., Unit, Suite, and/or Bldg. No.) or P.O. Route and Box No.			Policy Number:	
City	State	ZIP Code	Company NAIC Number:	

SECTION D – SURVEYOR, ENGINEER, OR ARCHITECT CERTIFICATION (CONTINUED)

Copy both sides of this Elevation Certificate for (1) community official, (2) insurance agent/company, and (3) building owner.

Comments:

Signature _____ Date _____

SECTION E – BUILDING ELEVATION INFORMATION (SURVEY NOT REQUIRED) FOR ZONE AO AND ZONE A (WITHOUT BFE)

For Zones AO and A (without BFE), complete Items E1–E5. If the Certificate is intended to support a LOMA or LOMR-F request, complete Sections A, B, and C. For Items E1–E4, use natural grade, if available. Check the measurement used. In Puerto Rico only, enter meters.

- E1. Provide elevation information for the following and check the appropriate boxes to show whether the elevation is above or below the highest adjacent grade (HAG) and the lowest adjacent grade (LAG).
- a) Top of bottom floor (including basement, crawlspace, or enclosure) is _____ feet meters above or below the HAG.
- b) Top of bottom floor (including basement, crawlspace, or enclosure) is _____ feet meters above or below the LAG.
- E2. For Building Diagrams 6–9 with permanent flood openings provided in Section A Items 8 and/or 9 (see pages 8–9 of instructions), the next higher floor (elevation C2.b in the diagrams) of the building is _____ feet meters above or below the HAG.
- E3. Attached garage (top of slab) is _____ feet meters above or below the HAG.
- E4. Top of platform of machinery and/or equipment servicing the building is _____ feet meters above or below the HAG.
- E5. Zone AO only: If no flood depth number is available, is the top of the bottom floor elevated in accordance with the community's floodplain management ordinance? Yes No Unknown. The local official must certify this information in Section G.

SECTION F – PROPERTY OWNER (OR OWNER'S REPRESENTATIVE) CERTIFICATION

The property owner or owner's authorized representative who completes Section's A, B, and E for Zone A (without a FEMA-issued or community-issued BFE) or Zone AO must sign here. The statements in Sections A, B, and E are correct to the best of my knowledge.

Property Owner's or Owner's Authorized Representative's Name _____

Address _____ City _____ State _____ ZIP Code _____

Signature _____ Date _____ Telephone _____

Comments _____

Check here if attachments.

SECTION G – COMMUNITY INFORMATION (OPTIONAL)

The local official who is authorized by law or ordinance to administer the community's floodplain management ordinance can complete Sections A, B, C (or E), and G of this Elevation Certificate. Complete the applicable item(s) and sign below. Check the measurement used in Items G8–G10. In Puerto Rico only, enter meters.

- G1. The information in Section C was taken from other documentation that has been signed and sealed by a licensed surveyor, engineer, or architect who is authorized by law to certify elevation information. (Indicate the source and date of the elevation data in the Comments area below.)
- G2. A community official completed Section E for a building located in Zone A (without a FEMA-issued or community-issued BFE) or Zone AO.
- G3. The following information (Items G4–G10) is provided for community floodplain management purposes.

G4. Permit Number _____	G5. Date Permit Issued _____	G6. Date Certificate Of Compliance/Occupancy Issued _____
-------------------------	------------------------------	---

- G7. This permit has been issued for: New Construction Substantial Improvement
- G8. Elevation of as-built lowest floor (including basement) of the building: _____ feet meters Datum _____
- G9. BFE or (in Zone AO) depth of flooding at the building site: _____ feet meters Datum _____
- G10. Community's design flood elevation: _____ feet meters Datum _____

Local Official's Name _____ Title _____

Community Name _____ Telephone _____

Signature _____ Date _____

Comments _____

Check here if attachments.

The comments section is too small for my typical comments. I usually skip page 2.

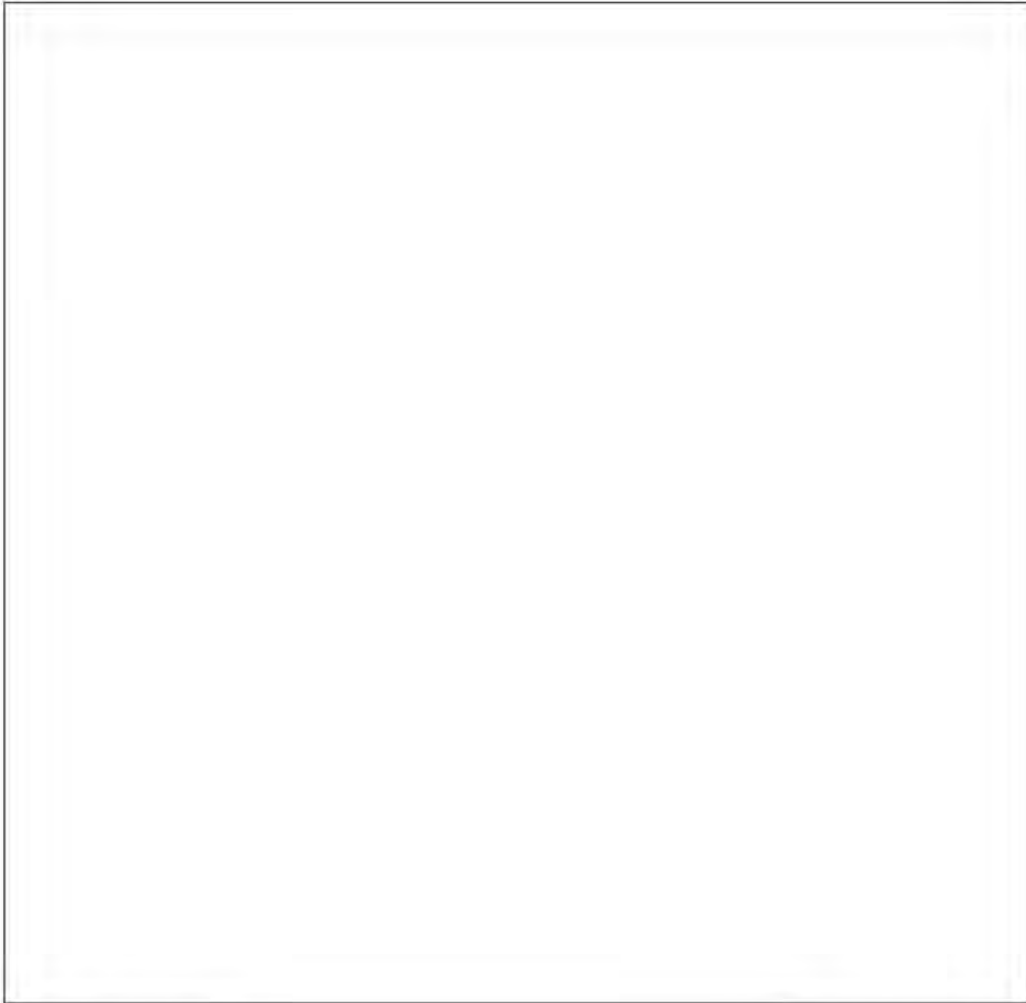

Building Photographs

See Instructions for Item A6

IMPORTANT: In these spaces, copy the corresponding information from Section A.

			FOR INSURANCE COMPANY USE
Building Street Address (including Apt., Unit, Suite, and/or Bldg. No.) or P.O. Route and Box No.			Policy Number
City	State	ZIP Code	Company NAIC Number

If using the Elevation Certificate to obtain NFIP flood insurance, affix at least 2 building photographs below according to the instructions for Item A6. Identify all photographs with date taken, "Front View" and "Rear View"; and, if required, "Right Side View" and "Left Side View." When applicable, photographs must show the foundation with representative examples of the flood openings or vents, as indicated in Section A8. If submitting more photographs than will fit on this page, use the Continuation Page.

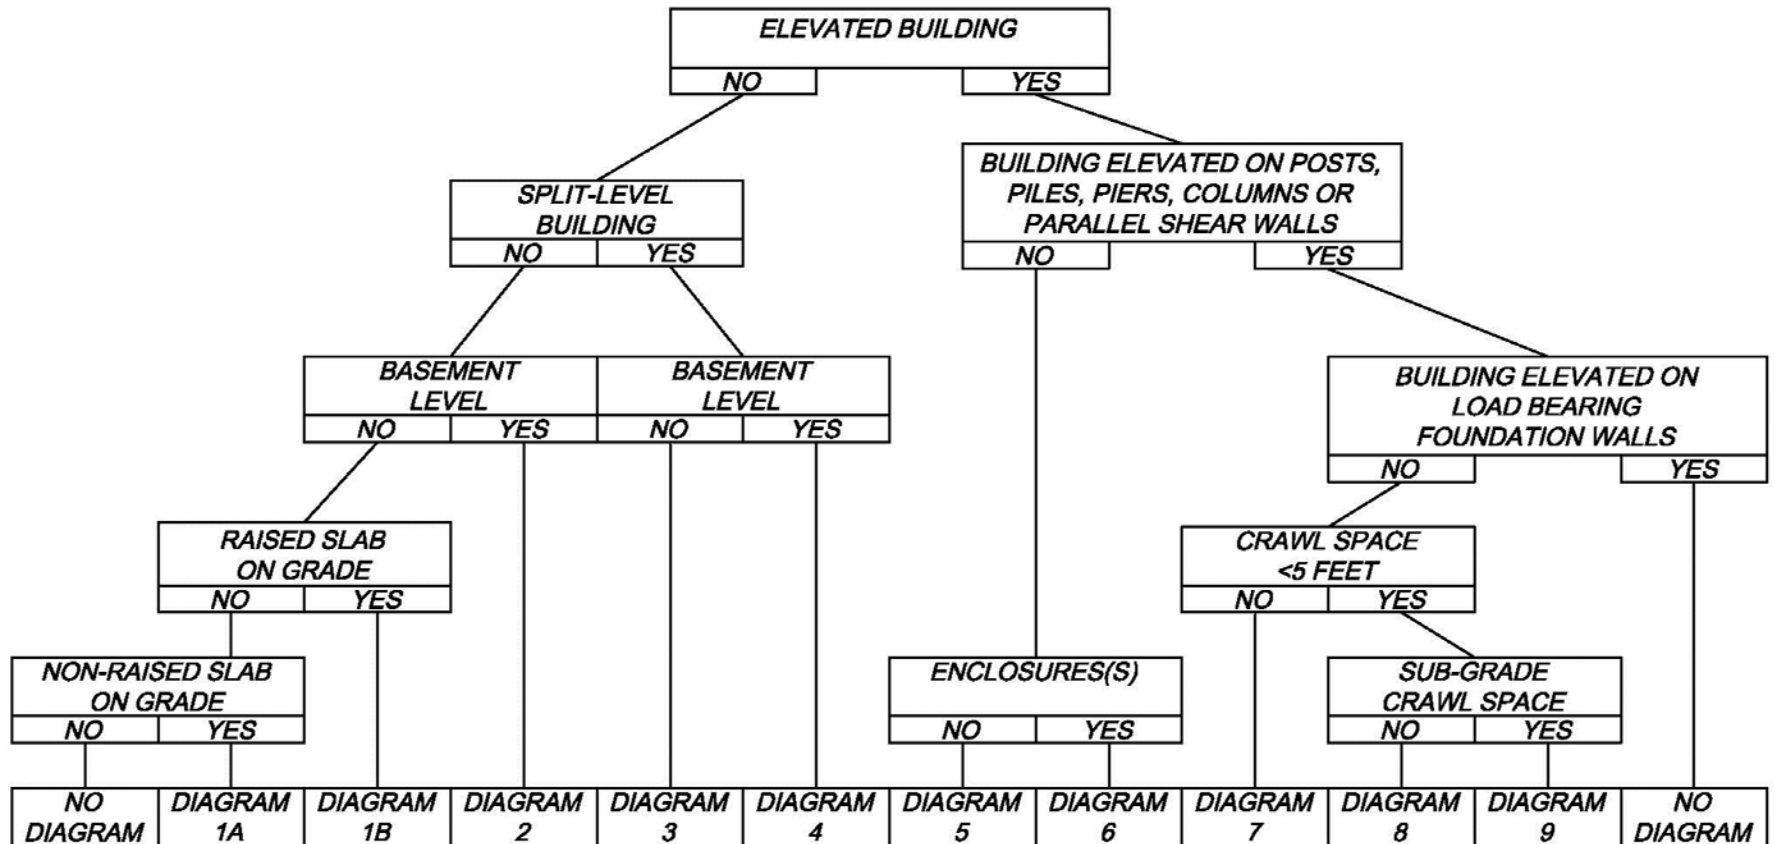

Building photographs must be dated.

Comments

- The basis of the Latitude and Longitude.
- Describe the benchmark used, especially if GPS is used.
- Notes and photographs of the vents, if any.
- Photographs of the lowest machinery or equipment servicing the building.
- Document anything else that comes to mind.

BUILDING DIAGRAM FLOW CHART

FEMA TUTORIALS

The screenshot shows a web browser window with the URL www.fema.gov/online-tutorials. The browser's address bar includes navigation icons and a search bar. Below the browser, the FEMA website header features the agency logo, the text "FEDERAL EMERGENCY MANAGEMENT AGENCY", and a search bar with the placeholder text "What are you looking for?".

The main navigation menu includes the following categories:

Electronic Letter of Map Amendment (eLOMA)

What is eLOMA?

The Federal Emergency Management Agency (FEMA) has designed an interactive online determination tool for MT-1 requests called electronic Letter of Map Amendment (eLOMA). The eLOMA is a web-based application within the Mapping Information Platform (MIP) that provides Licensed Professionals (LP) and Certified Professionals (CP) with a system to submit simple Letter of Map Amendment (LOMA) requests to FEMA. This tool is designed to make a determination based on the information submitted by LPs and CPs, allowing them to generate a determination from FEMA in minutes. The initial release of eLOMA will enable LPs and CPs to make requests for existing single residential structures or properties, provided no fill has been placed to raise the elevations of the structure or property. Approximately half of the LOMAs processed annually (about 29,000 cases) meet the requirements of eLOMA.

What are the advantages of eLOMA?

The eLOMA was designed to facilitate the LOMA process. Historically, because of manual processing, obtaining a LOMA took up to 60 days, provided all required documentation was on file. Using eLOMA, LPs and CPs can receive a determination in the time that it takes to enter the required information online.

How does eLOMA differ from the traditional LOMA process?

A LOMA is a letter from FEMA stating that an existing structure or parcel of land that has not been elevated by the placement of fill is not expected to be inundated by the 1-percent-annual-chance flood (the base flood). To receive an eLOMA, LPs and CPs must register on the MIP to establish an account. Once registered, they will be able to enter property-specific information that they have certified as accurate, as well as data taken from FEMA's Flood Insurance Rate Maps (FIRMs) and Flood Insurance Study (FIS) reports. LPs and CPs should refer to FIS reports because the Base Flood Elevations (BFEs) are not always found on the FIRMs; the BFE data in the FIS report is generally more accurate. The eLOMA online service will then make a determination based on the submitted information. LPs and CPs will then be able to print a copy once the request is processed. An eLOMA document will serve the same functions as a standard LOMA. The only difference between the two is that the online determination is made automatically with standard checks instead of the lengthier manual review used in traditional LOMA processing. In addition, eLOMA does not replace the LOMA procedure. The eLOMA determination tool is an optional process applicable to only the most basic LOMA requests. Currently, there is no charge to receive a LOMA, and eLOMAs also will be available to LPs and CPs at no cost.

How does eLOMA create determinations through the MIP?

A surveyor or engineer must set up an account through the MIP using individual license certification information. Once the LP or CP registers on the MIP, he or she can log into eLOMA. Once logged in, he or she will be given the option to create a new application or resume a previously saved application. The LP or CP will be asked to submit certified elevations. The eLOMA will make a comparison of the submitted BFE with the submitted Lowest Adjacent Grade (LAG) or Low Lot Elevation (LLE) and provide an instant determination if the application has not been selected for FEMA audit. For quality purposes, eLOMA will ensure that all required information has been entered. If the

application is selected for FEMA audit, the LP or CP will receive instructions for submitting their application materials. If the application is approved, the LP or CP will receive notification that they can login and print the determination. If the application is rejected, the LOMA will be completed by FEMA using the standard, manual MT-1 process and the LP or CP will be audited again after his or her next submittal. After a successful audit, the LP or CP will be able to generate eLOMA determinations online. However, he or she will still be subject to random audits.

What is the future of eLOMA?

FEMA will be closely monitoring the progress of eLOMA to consider expanding its capabilities to include:

- Offering broader application requests
- Expanding the use of eLOMA to include additional users
- Adjusting audit frequency as needed

How to register to become an eLOMA licensed professional

Fill out the *eLOMA Registration Form* located at <https://hazards.fema.gov> and send it to the eLOMA Coordinator. Instructions are provided on the form. Once your request for eLOMA access has been received, it will be reviewed to ensure that you are eligible to use the eLOMA application. If your request is approved you will receive an e-mail with your login information (username and password). Your username and password will allow you to access the eLOMA application through the MIP.

eLOMC

Requires registration

Expect an audit. (It's not that big a deal.)

Expedites the process.

The Online LOMC request tool is the web-based version of the paper MT-1 form. You may request the following determinations from FEMA online:

Letters of Map Amendment (LOMAs) – Typically, a LOMA is issued when the scale of the FIRM does not allow for small areas of natural high ground to be shown outside the SFHA

Conditional Letter of Map Amendment (CLOMA) – A letter from FEMA stating a proposed structure that is not to be elevated by fill (natural grade) would not be inundated by the base flood if built as proposed

Letters of Map Revision based on Fill (LOMR-F) – A LOMR-F is similar to a LOMA, but instead of being based on natural ground elevations, the property or structure has been elevated by fill in order to elevate it above the flood elevation

Conditional Letter of Map Revision-Fill (CLOMR-F) – A letter from FEMA stating a parcel of land or proposed structure that will be elevated by fill would not be inundated by the base flood if fill is placed on the parcel as proposed or the structure is built as proposed

Letters of Map Revision (LOMRs) – A LOMR is an official revision to an effective FIRM map that may change flood insurance risk zones, floodplain and/or floodway boundary delineations, plain metric features, and/or BFE. Unlike LOMAs and LOMR-Fs, a LOMR usually results in reprinting a portion of a FIRM

Conditional Letter of Map Revision (CLOMR) – A CLOMR is a letter from FEMA's stating a proposed project that would, upon construction, affect the hydrologic or hydraulic characteristics of a flooding source and thus result in the modification of the existing regulatory floodway, the effective BFE or SFHA

The forms are government forms.

Conditional Letters of Map Amendment and Conditional Letters of Map Revision are typically required prior to the issuance of a building permit.

Some local regulations prohibit fill within the flood plain. Fill is never that easy, but don't worry, there is a technical bulletin that can help.

Ensuring That Structures Built on Fill In or Near Special Flood Hazard Areas Are Reasonably Safe From Flooding

Be on the lookout for other resources. They are out there.

Foundations in Coastal Areas

FEMA

HOME BUILDER'S GUIDE TO COASTAL CONSTRUCTION FEMA 499/August 2005 Technical Fact Sheet No. 11

Purpose: To describe foundation types suitable for coastal environments.

Key Issues

- Foundations in coastal areas must elevate buildings above the Base Flood Elevation (BFE), while withstanding flood forces, high winds, scour and erosion, and floating debris.
- Foundations used for inland construction are generally not suitable for coastal construction.
- Deeply embedded pile or column foundations are required for many coastal areas; in other coastal areas, they are recommended – instead of solid wall, crawlspace, slab, or other shallow foundations that can be undermined easily. ("Deeply embedded" means sufficient penetration into the ground to accommodate storm-induced scour and erosion and to resist all design vertical and lateral loads without structural damage.)
- Areas below elevated buildings in V zones must be "free of obstructions" that can transfer flood loads to the foundation and building (see Fact Sheet No. 27).

Storm surge and waves overtopping a barrier island during Hurricane Frederic.

Foundation Design Criteria

All foundations for buildings in flood hazard areas must be constructed with flood-damage-resistant materials (see Fact Sheet No. 8) and must do two things in addition to meeting the requirements for conventional construction: (1) elevate the building above the BFE, and (2) prevent flotation, collapse, and lateral movement of the building, resulting from loads and conditions during the design flood event (in coastal areas, these loads and conditions include inundation by fast-moving water, breaking waves, floating debris, erosion, and high winds).

Because the most hazardous coastal areas are subject to erosion and extreme flood loads, **the only practical way to perform these two functions is to elevate a building on a deeply embedded and "open" (i.e., pile or column) foundation.** This approach resists storm-induced erosion and scour, and it minimizes the foundation surface area subject to lateral flood loads – it is required by the National Flood Insurance Program (NFIP) in V zones (even when the ground elevation lies above the BFE) and is recommended for coastal A zones. However, even a deeply embedded open pile foundation will not prevent eventual undermining and loss due to long-term erosion (see Fact Sheet No. 7).

Performance of Various Foundation Types in Coastal Areas

There are many ways to elevate buildings above the BFE: fill, slab-on-grade, crawlspace, stemwall, solid wall, pier (column), and pile. Not all of these are suitable for coastal areas. In fact, several of them are prohibited in V zones
